DBMS Assignment

Tutorial-02

Course Title: Database Management Systems
Course Code: CSE-414

Submitted to

Course Instructor
Dr.Rudra Pratap Deb Nath
Professor
Dept. of Computer Science & engineering
University of Chittagong

Submitted by

Team Name: ByteForge
Department: Computer Science and Engineering
Semester: 4th Semester

Submission Date:
April 14, 2026

Task:01

1.Document and describe your database in the way you would do it (or have done it) in a project report.

Answer:

(I)Introduction: This database is designed to store and manage medical information related to drugs,disease and their relationships.The system is designed to support queries that analyze drug–disease relationships, identify common side effects, and explore clinical trial data efficiently so that users can retrieve meaningful insights about drugs and their applications.

(II)Scoop of the Database: The database includes the following types of information:

1.Drugs and their categories.

2.Diseases and their categories.

3.Side effects and Interactions of Drugs.

4.Commercial Drug Products and Companies.

5.Clinical trial information and their researcher and location.

(III)Assumption: To simplify the design, the following assumptions are made:

1.A drug can treat multiple diseases.

2.A disease can be treated by multiple drugs.

3.A drug can have multiple side effects.

4.A side effect can be caused by multiple drugs.

5.Drug interactions occur between two or more drugs.

6.A drug may have multiple commercial products.

7.A drug may be involved in multiple clinical trials.

(IV)Entities & Relationship

Entities:

1.Drug

2.Disease

3.Side-effect

4.Clinical Trial

5.Researcher

6.product

7.Company

Relationship:

1.Drugs and Diseases(M:N)

2.Drugs and Side Effects(1:N)

3.Drugs and Clinical Trials(M:N)

4.Drugs can interact with other Drugs (self-relationship)

5.Drugs and Products(1:N)

6.Products and company(N:1)

7.Clinical trials and Researcher(1:1)

2. Provide a list of tables with attributes that you would use to store your data.

3. In case you already have a good command of SQL, add the SQL commands that create your database.

Answer:

DATABASE

```sql
DROP DATABASE IF EXISTS PHARMA_DB;
CREATE DATABASE IF NOT EXISTS PHARMA_DB;

```

Task:02

1. Identify relevant data (consider the sample queries included in this document).

Answer

To design the database, the relevant data is identified based on the requirements and sample queries. The goal is to determine what information must be stored so that all required queries can be answered efficiently.

→ Identified Data Entities and Attributes

1.Drug

drug_name(PK)

drug_category

interacts_with

*Needed for: almost all queries (a, b, c, d, e, f, g, h, i)

2.Side Effect

side_effect_name(PK)

*Needed for:

(a) nausea

(c) cough and headache

(g) top side effects

3.Disease

disease_name(PK)

disease_category

Needed for:

(d) endocrine diseases

(e) immunological vs hematological

(f) hydrocortisone vs etanercept

(j, k) respiratory & cardiovascular

4.Product

product_name(PK)

company_name

5.Clinical Trial

title(PK)

status

start_date

-Needed for query (i)

completion_date

-Needed for query (i)

participants

-Needed for query (h)

condition

address(Composite attribute: country, department, institution)

-Needed for query (l)

6.Researcher

Name(PK)

Relationship	**Entities Involved**	**Cardinality**	**Queries Supported**
treats	Drug ↔ Disease	M:N	(d), (e), (f), (g)
has	Drug ↔ Side Effect	M:N	(a), (c), (g)
is marketed as	Drug → Product	1:N	commercial product lookup
interacts with	Drug ↔ Drug	M:N (self-ref)	(b)
studies	Clinical Trial ↔ Drug	M:N	(h), (i), (j), (k)
conducted by	Clinical Trial → Researcher	N:1	(j), (k)
